

# Value-Based Care Reporting

Azara DRVS' Value-Based Care Reporting functionality facilitates collaboration between providers and health plans in service of value-based care contracts. Through the ingestion of enrollment, care gaps, and claims data, alongside existing EHR data, DRVS can serve as the whole-population hub for providers' quality and risk-sharing initiatives. While the tools available depend on what data is shared by health plans, the goal is the same: unify and simplify the data care teams need to succeed in value-based care.

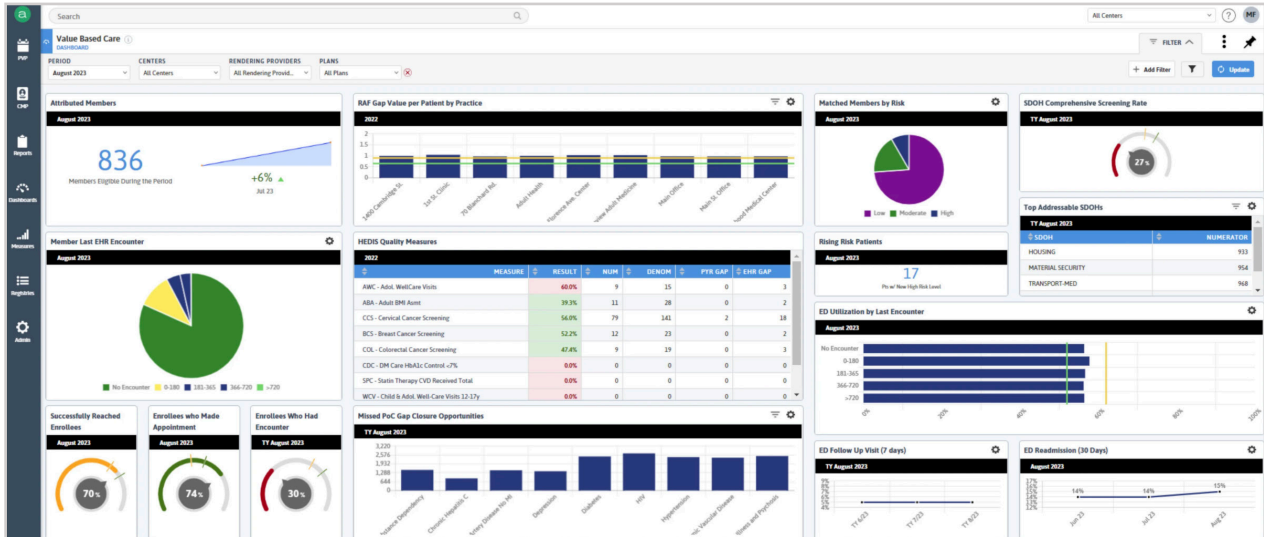

## Azara solutions empower organizations to succeed in multi-payer value-based care environments by:

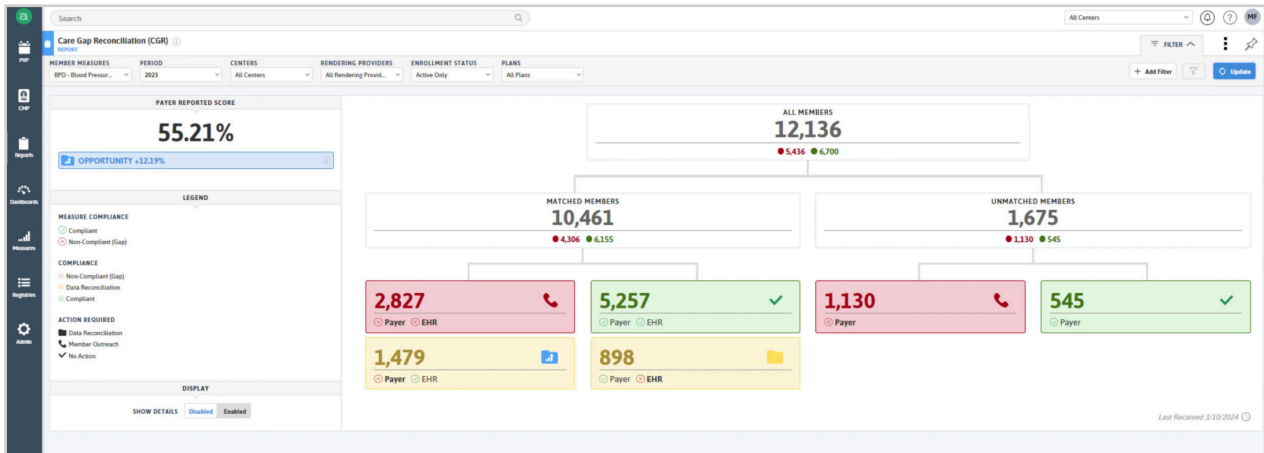

- Identifying attributed, but never seen, members and matching health plan enrollment to EHR medical records
- Reconciling care gaps between health plan and EHR data sources
- Surfacing risk-adjustment factor (RAF) gaps for a patient through either HCC or CDPS algorithms
- Calculating certified HEDIS measures from an integrated set of clinical and claims data
- Predicting which patients/members will be heavy utilizers and drive total cost of care
- Providing supplemental data to health plans via NCQA Data Aggregator Validation Program certified CCDs

## Organizations use Azara solutions to engage with health plans and members – improving care by enabling providers to:

**Unify member insights** by aggregating and standardizing supplemental data directly from health plans– empowering care teams with a comprehensive and timely understanding of patients’ conditions and risk factors.

**Significantly reduce wasted time and effort** by closing care gaps with Azara’s automated care gap reconciliation functionality which seamlessly matches payer-calculated gaps against EHR data–revealing the true status of gaps and ensuring resources are focused on the issues that matter most.

Azara DRVS supports value-based care success with an experienced Clinical Transformation team and a comprehensive library of over 600 measures – including over 50 certified HEDIS® measures, CMS eCQM measures used for MSSP, MCP, & PCF programs, and a broad range of other clinical quality measures, covering all health plan members.
